Hello there!

This is a little instruction that can help you access all extra glyphs (ligatures, alternatives etc) in my fonts.

If you use Mac:

1. Install the font as you usually do (in case it's your first time - open font folder, double click on .OTF file and click «install»).

2. Search for a program «Font Book» typing its name in the search field.

3. Open Font Book and click View on top of your screen, then choose «Repertoire». You'll see all the characters included in the font that you select.

4. In order to use some character select it and click "Edit" and "Copy".

5. Go to any application where you want to use the character and right click and Paste.

If you use Windows:

1. Install the font as you usually do.

2. Open Windows Character Map. This application is included on all Windows computers. To access Character Map just hit the windows bar and start typing "Character Map".

3. Open the application and in the "Font" dropdown, select the font you want to use and make sure the "Advanced View" box is checked.

4. In the "Group by" dropdown select "Unicode Subrange"

5. In the "Group By" menu that opened on the right side, scroll to the bottom and select "Private Use Characters".

6. After that on the left side you'll be able to see all the PUA encoded characters.

If you want to use one of the characters click "Select" and after click "Copy". Now you can go to any application and Paste the character.

That's all!

Best,

Oksana
